

BMF

Bank Multi Function

The TELETUBE **BMF** system is a specialized pneumatic conveyor for banking applications.

It is a two-way, single tube system to exchange carriers between desk stations, back-office stations, intermediate storage units, and cash evacuation stations.

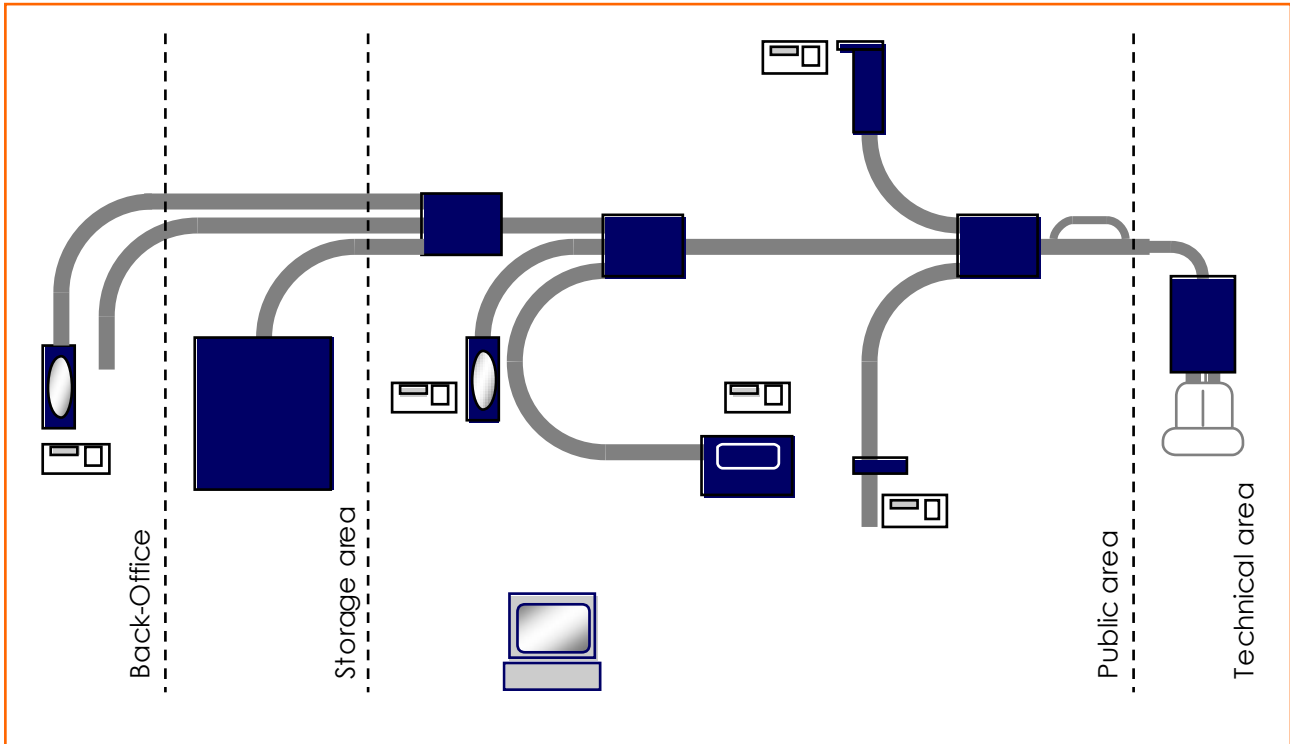

The **BMF** system uses 110mm tubing to create complex networks driven by a central gear. The system offers plenty of possibilities that can be selected by a flexible configuration program. Optionally, a PC provides for extended monitoring options.

Different station types can be used, ranging from simple open end tubes up to full automatic motorized desk-integrated stations, with parking function.

A variety of carrier types are available, adapted to the needs of the application.

Interfaces for existing software applications, and connections to external alarm systems are provided.

BMF - Bank Multi Function

- Special banking application to create a cash-less public area
- Fully configurable system with up to 99 users and 99 stations
- Up to 48 storage locations for carriers
- Vertical, horizontal or lateral departure stations
